Education

The University of Texas at Austin — Austin, TX
Bachelor of Science in Electrical & Computer Engineering — *Aug. 2022 – December 2026*

Experience

Software Engineer Intern — June 2026 – August 2026
Capital One — *Plano, TX*

- Engineered a real-time event-processing pipeline in Go using Kafka, Amazon SQS, and AWS Lambda to **process 100K+ Auto Finance events daily** within a production distributed system.
- Built and deployed cloud-native serverless infrastructure with **AWS CloudFormation and CloudWatch**, ensuring reliability and observability across critical Auto Finance services.
- Developed production backend microservices in Go within an Agile team, leveraging **Docker, GitHub, Jenkins, and CI/CD pipelines** to deliver scalable cloud applications.

Network Engineer Intern — May 2025 – August 2025
Spectrum — *Austin, TX*

- Coordinated installation of **8+ off-net Layer 2 devices per week** with ≤ 1 hour turnaround times.
- Developed a Python application to standardize post-installation records, improving team efficiency by **30%**.
- Validated Layer 2 circuit designs against customer-defined acceptance criteria before handoff to installation team.

System Engineer Intern — January 2025 – May 2025
Symbotic — *Raymond, NH*

- Monitored automated conveyors, vertical lifts, and robotic palletizers for 8+ production lines, troubleshooting disruptions to maintain production flow.
- Investigated production-critical system issues and coordinated escalations with engineering and operations teams to restore equipment functionality.
- Developed a Python application to flag potentially unusable shipping freight, helping operations teams identify problematic SKUs for further investigation.

Projects

RecipeCart | *Typescript, Railway, Docker, CSS* — July 2026

- Built a TypeScript pipeline converting TikTok recipes into Kroger cart items using **OCR and Claude**.
- Developed a deterministic matching engine ranking grocery products by availability, package fit, and unit price.
- Implemented an OAuth2-secured cart workflow with explicit user approval, encrypted tokens, and automated secret redaction.

A.T.L.A.S | *Python, Flask, HTML, CSS, Javascript* — May 2025 – August 2025

- Built a Python/Flask web app standardizing post-installation logging, improving team efficiency by **30%.**
- Conducted user testing with off-net installation teams to iteratively refine features based on direct feedback.
- Documented technical architecture, reducing developer onboarding time by **12%**.

Suspect Genie | *Python, PyQt, TensorFlow, Keras, Scikit-learn* — January 2025 – May 2025

- Built a neural network classifier to assess shipping freight viability using case dimensions and weight.
- Developed a data preprocessing pipeline with NumPy, Pandas, and Scikit-learn to clean freight records and prepare features for model training.
- Trained and evaluated classification models with TensorFlow and Keras to identify patterns associated with unusable freight.
- Built a PyQt interface enabling non-technical teams to upload CSV files and review SKU-level predictions for targeted investigation.

Technical Skills

Languages: Go, Java, Javascript, Python, C/C++, SQL (Postgres), HTML/CSS, MatLAB
Frameworks: PyQT, Flask, JUnit, JavaFX, Langchain
Developer Tools: Jira, Jenkins, Claude Code, Docker, Kubernetes, Salesforce, Git, VS Code, PyCharm, IntelliJ, Anaconda, Jupyter Notebook, Supabase, MongoDB
Libraries: Pandas, NumPy, Matplotlib, Scikit-learn, Tensorflow, Keras, Pytorch
